

DETAILED LESSON PLAN	Teacher	RONALYN C. DAVID	Grade Level	Grade 10
	Date	February 17, 2026	Learning Area	TLE-AGRICROP
	Class Time	Tuesday 2:00am – 3:00am	Quarter	4 TH

PARTS OF THE PLAN	TEACHER’S ACTIVITY
I. LEARNING COMPETENCY/OBJECTIVES	
Content Standards	The learners demonstrate understanding of the importance of routine checking and preventive maintenance of farm tools and equipment to ensure safety, efficiency, and proper performance during agricultural operations.
Performance Standards	The learners are able to identify faulty and functional farm tools and explain proper checking and preventive maintenance procedures to ensure safe and efficient use of irrigation and farm tools and equipment.
Competency/ies	The learners should be able to identify the causes of faulty hand tools and classify tools as functional or faulty by applying proper routine checking and preventive maintenance practices to ensure safety and efficiency in farm operations. TLE_AFA9-12FM-IIb-c-2
Objectives	At the end of the lesson, the learners will be able to: a.) Identify and explain the common causes of faulty hand tools such as rust, loose handles, dull edges, and physical damage. b.) Demonstrate awareness of proper tool care and safety by clearly articulating and sequencing preventive maintenance procedures for hand tools.; and c.) Classify tools as functional or faulty based on given situations while prioritizing personal safety, efficiency, and responsible tool use.
II. CONTENT	Identifying the Causes of Faulty Hand Tools and the Importance of Preventive Maintenance
III. LEARNING RESOURCES	
A. References	
1. Teacher’s Guide	
2. Learner’s Materials	
3. Additional Materials from Learning Resource	-n/a-
B. Materials Needed	• TLE Learner’s Module Grade 10 – Agricultural Crops Production. • Charts illustrating common tool faults (corrosion, dullness, breakage). • Activity sheets • AI-generated visual cue (images of functional vs faulty tools) • Computer and LCD monitor

IV. PROCEDURES	TEACHER'S ACTIVITY	STUDENTS' ACTIVITY	INDICATOR & ANNOTATION
A. Preliminary	Prayer Greetings Checking of attendance: Class secretary, kindly check the attendance of your classmates. Setting up rules: ➤ Keep the classroom organized and tidy. ➤ Speak one at a time—raise your hand before talking. ➤ Join in all class activities. Anyone want to add more or share concerns about our classroom rules?	(The class secretary will check the attendance sheet) Students will listen attentively to the instructions and reminders given by the teacher.	
B. Reviewing previous lesson or presenting the new lesson (ELICIT)	Before we begin our class, kindly arrange your chairs and pick up any pieces of paper around you. Please give your full attention to our lesson and avoid unnecessary noise. Okay class, since you are now all prepared to learn, let me ask you a question. Look closely at the screen.  1. What differences do you observe between the tools in Set A and Set B? 2. What might be the result if we use the tools in Set A Great observation, class! Set A tools are rusty and unsafe, while Set B tools are clean and ready to use. Faulty tools make work harder and can cause serious injuries, while well-maintained tools ensure safety and efficiency. This is why proper care and maintenance are essential, and today's lesson will focus on identifying faulty tools, their causes, and preventive maintenance.	Set A tools are rusty, broken, and unsafe. Set B tools are clean and ready to use. If we use Set A, accidents may happen and work will be inefficient	Indicator 1.7.2 Use effective verbal and non-verbal classroom communication strategies to support learner understanding, participation, engagement, and achievement. Annotation: The teacher used guided questioning and visual presentation of tool sets (Set A and Set B) to engage learners in identifying differences between functional and faulty tools. Through clear verbal instructions and the use of visual cues, learners were encouraged to observe, analyze, and express their ideas. This strategy

			promoted active participation, enhanced understanding of tool conditions, and helped learners connect the lesson to real-life safety and efficiency in using farm tools.
C. Establishing a purpose of the lesson/ Motivation (ENGAGE)	Alright, class, to understand today’s lesson better, we will have a short activity called “Spot the Defect”. <i>(Distributes index cards with faulty tool descriptions.)</i> Instructions: 1. Each group will receive one card. 2. Read the description carefully. Then, identify the primary defect of the tool and write down one immediate danger or consequence of using it in its current state. 3. You have five minutes. 4. Work together and be ready to share your answers. ACTIVITY 1: SPOT THE DEFECT 1. Rusty bolo  2. Loose hammer head 	Design, adapt, and implement teaching strategies that are responsive to learners’ diverse needs, interests, and abilities. Annotation: The teacher implemented the “Spot the Defect” activity using index cards with different tool conditions to actively engage learners in identifying defects and associated risks. This strategy allowed learners to work collaboratively, analyze real-life situations, and apply critical thinking in determining causes and dangers of faulty tools. By encouraging group discussion and sharing of answers, the activity catered to diverse learning styles and promoted active participation, deeper understanding, and awareness of safety and	

	3. Dull shear  Very good, Class! You were able to spot the defects and connect them to possible dangers. This shows us why tool maintenance is so important. Today, we will learn more about the causes of faulty tools and how preventive maintenance keeps us safe and efficient.	3. Dull shear • Defect: Blade is dull, chipped, or uneven. • Danger: Requires more force, may slip and cause cuts or damage plants.	preventive maintenance practices.
D. Presenting Examples/ instances of the new lesson/ Presentation (ENGAGE)	Class, let us now discuss the root causes of why tools become faulty. There are three main categories we must remember: 1. Physical Damage – misuse, dropping, or natural wear and tear. 2. Environmental Damage – rust or corrosion due to moisture, chemicals, or improper storage. 3. Neglect – lack of cleaning, lubrication, or tightening after use. Can you give me an example of neglect that can make a tool faulty? Now that we know the causes, let's focus on the solution. Preventive maintenance is the key to keeping tools safe and efficient. What are the five non-negotiable steps we must perform after every use or before storage?	<i>(Students listen attentively.)</i> Not cleaning a shovel after use, leaving it muddy and wet, which causes rust. Failing to sharpen a bolo, making it dull and unsafe. Not tightening the screws of a hoe, which makes the blade loose. 1. Cleaning – remove dirt, mud, or plant residue. 2. Inspection – check for	Indicator 1.4.2 Use a range of teaching strategies that enhance learner achievement in literacy and numeracy skills. Annotation: The teacher facilitated a structured discussion by presenting clear categories of tool faults (physical damage, environmental damage, and neglect) and guided learners through probing questions to elicit examples and explanations. This approach strengthened learners' comprehension and vocabulary development related to tool maintenance while promoting critical thinking.

	cracks, loose parts, or rust. 3. Tightening – secure bolts, screws, or handles. 4. Sharpening – keep blades sharp for efficiency and safety. 5. Oiling/Lubricating – protect metal parts from rust and ensure smooth operation. Excellent! These five steps are simple but powerful. If we practice them regularly, our tools will last longer, work better, and most importantly, keep us safe. Finally, let us connect everything we've learned. Why is classifying a tool as functional or faulty critical? What does 'functional' really mean in terms of safety and efficiency? Very good! Always remember: a functional tool protects the user and ensures quality work, while a faulty tool is a hazard that must never be ignored. Before we proceed to your activity, do you have any questions and clarifications?	By asking learners to enumerate and explain the five preventive maintenance steps and to define functional versus faulty tools, the teacher reinforced understanding through active recall, sequencing, and conceptual clarification, leading to improved learner engagement and mastery of the lesson. Functional means safe and efficient to use. Faulty means defective, unsafe, and dangerous. Classifying tools helps us decide whether to repair, replace, or safely store them. None, ma'am.
--	---	--

E. Discussing new concepts and practicing new skills no.1 (EXPLORE)	For our activity today, you will be divided into 4 groups. Each group will receive one scenario describing the condition of a tool. Your task is to classify the tool as either Functional or Faulty, and explain your answer based on safety and efficiency. You will have 7 minutes to discuss and prepare your group’s response ACTIVITY 2: FUNCTIONAL OR FAULTY Scenarios: Group 1: A spade with handle wrapped in electrical tape due to a splintered crack. Group 2: A clean, sharpened pruning shear stored properly. Group 3: A rake missing two tines. Group 4: A sickle with a blade loose from the handle. Directions: 1. Read your assigned scenario carefully. 2. Discuss within your group whether the tool is Functional or Faulty. 3. Write down your classification and provide at least one reason focusing on safety and efficiency. 4. Be ready to present your answer to the class. Before you start doing the activity please be guided with the following criteria.	Criteria for Evaluation: • Accuracy of Classification- 5 pts	Indicator 3.4.2 Facilitate learning experiences that require learners to think critically, analyze, and make informed decisions while promoting collaboration and safe practices. Annotation: The teacher implemented a group-based activity, “Functional or Faulty,” where learners analyzed real-life tool scenarios to classify them as functional or faulty. By requiring learners to justify their answers based on safety and efficiency, the activity promoted critical thinking, problem-solving, and application of preventive maintenance knowledge. Group discussion encouraged collaboration, communication, and peer learning, while focusing on safety awareness reinforced responsible tool use. The use of clear evaluation criteria (accuracy, explanation, and cooperation) ensured learners could self-assess and understand the practical consequences of using faulty tools.
---	--	--	---

	Process Questions: 1. Why is it important to classify tools as functional or faulty before use? 2. How does proper maintenance prevent tools from becoming faulty? 3. What risks do faulty tools pose to both the user and the work output?	• Clarity of Explanation • (Safety/Efficiency) - 5 pts • Group Cooperation - 5 pts Total: ----15 points It is important because functional tools are safe and efficient, while faulty tools can cause accidents or injuries. Classifying them helps us decide whether a tool can be used, repaired, or replaced before it becomes a hazard. Proper maintenance—like cleaning, sharpening, tightening, and oiling—removes dirt, prevents rust, and keeps parts secure. These steps extend the lifespan of tools and ensure they remain safe and effective for work. Faulty tools can injure the user through slips, breakage, or splinters. They also reduce efficiency, making tasks harder, slower,	
--	--	---	--

		and less accurate. In the long run, they increase costs because tools wear out faster or need replacement.	
<i>F. Developing Mastery</i> (EXPLAIN)	Class, let's check if we really understood the lesson. I will ask some questions, and I want you to answer in your own words. 1. As what you've learned, faulty tools are unsafe and inefficient. What do you think will happen if farmers continue to use faulty tools without repair or maintenance? 2. Preventive maintenance ensures tools remain functional and safe. As a student, how can you apply preventive maintenance practices at home or in school to promote safety and efficiency?	Possible Student Answers: Farmers may get injured while working, like cuts or splinters from broken handles Work will take longer and be less efficient because faulty tools don't function properly. The lifespan of the tools will shorten, leading to higher costs for replacement. Clean tools after every use to prevent rust and dirt buildup. Store tools properly in a dry place to avoid corrosion. Check and tighten loose parts before using tools. Sharpen blades regularly to make cutting easier and safer.	Indicator 3.3.2 Facilitate learning experiences that allow learners to reflect, articulate understanding, and apply knowledge and skills in real-life situations. Annotation: The teacher used reflective questioning to assess learners' understanding of faulty tools and preventive maintenance. By asking students to predict the consequences of using faulty tools and identify ways to apply preventive maintenance at home or school, learners were encouraged to connect lesson concepts to practical, real-life situations. This approach promoted critical thinking, personal responsibility, and application of safety practices. Learners' responses demonstrated comprehension of tool functionality, safety awareness, and efficiency, reinforcing the importance of maintaining tools properly for both

			work and daily life.
G. Finding practical application of concepts and skills in daily living (ELABORATE)	Now, you will apply what have you learned about our lesson. 1. What might happen if we continue using faulty tools?	Continuing to use faulty tools leads to accidents, inefficiency, and poor-quality work, so proper maintenance is essential for safety and productivity. The quality of work will be poor because damaged tools cannot perform properly. Faulty tools will wear out faster and need replacement, which increases costs.	Indicator 3.3.3 Design and facilitate learning experiences that enable learners to apply knowledge and skills in real-life contexts, promoting problem-solving, safety, and efficiency. Annotation: The teacher guided learners to reflect on the practical consequences of using faulty tools and encouraged them to articulate potential risks and inefficiencies. This activity helped learners connect theoretical knowledge to daily life, reinforcing the importance of proper tool maintenance for safety, productivity, and cost-efficiency. By analyzing real-world outcomes, learners developed critical thinking, decision-making, and responsibility for safe and effective practices, ensuring that lesson concepts are meaningful and applicable beyond the classroom.

H. Making Generalization and abstraction about the lesson (ELABORATE)	From the given activities, what is the difference between functional tools and faulty tools?	Functional tools are safe, efficient, and ready to use, while faulty tools are defective, unsafe, and can cause accidents.	Indicator 3.4.3 Guide learners to synthesize and generalize lesson concepts, promoting higher-order thinking and application in practical and safe contexts.
	How do we keep tools functional and safe for use?	We keep tools functional by cleaning them after use, storing them properly, and checking for defects regularly.	Annotation: The teacher facilitated learners' ability to make generalizations about functional versus faulty tools and the importance of preventive maintenance.
	What are the basic steps of preventive maintenance?	The five steps are: cleaning, inspection, tightening loose parts, sharpening blades, and oiling/lubricating before storage.	Through guided questions, learners identified key differences, outlined maintenance practices, and explained the rationale for classifying tools before use. This approach reinforced critical thinking, abstraction, and conceptual understanding while linking classroom knowledge to real-life practices in safety and efficiency.
	Why is it important to classify tools before using them?	Classifying tools ensures safety and efficiency. It helps us decide whether a tool can be used, repaired, or replaced before it becomes a hazard.	Learners were able to consolidate information, make informed decisions, and internalize responsible behaviors in handling farm tools.

H. Evaluating learning (EVALUATE)	Now, let's check your understanding of today's lesson. I will give you a short quiz with five questions. Please answer independently and honestly. Directions: Write the letter of the correct answer on your answer sheet. Work independently and avoid looking at your classmates' papers. 1. What is the most common cause of rust in hand tools? a. Proper storage b. Exposure to moisture c. Regular cleaning d. Tightening parts 2. Which of the following is an example of neglect in tool maintenance? a. Sharpening a blade b. Cleaning after use c. Leaving tools dirty and wet d. Tightening loose screws 3. What is the correct first step in preventive maintenance of tools? a. Sharpening b. Oiling c. Cleaning d. Tightening 4. Why is it important to classify tools as functional or faulty before use? a. A hammer with a loose head b. A rusty bolo c. A clean and sharpened shear d. A rake with missing teeth 5. Why is it important to classify tools as functional or faulty before use?	Answers: 1. B 2. C 3. C 4. C 5. B	Indicator 3.5.2 Assess learners' understanding and application of lesson concepts through formative and summative tools, providing opportunities to demonstrate knowledge, skills, and reasoning. Annotation: The teacher conducted a short multiple-choice quiz to evaluate learners' comprehension of faulty and functional tools, causes of tool defects, and preventive maintenance procedures. The quiz allowed learners to demonstrate knowledge recall, conceptual understanding, and the ability to apply safety and efficiency principles. By answering independently, learners practiced responsibility and integrity, while the assessment provided immediate feedback on their learning, helping the teacher identify areas that may require remediation or reinforcement.
--	--	--	--

	a. To make work slower b. To avoid accidents and ensure efficiency c. To increase tool cost d. To ignore tool condition		
I. Additional activities for application and remediation (EXTEND)	 Instruction: Research the safety inspection checklist for preventive maintenance of one heavy farm equipment (e.g., hand tractor, rototiller). List five items to check before operation and five items to check after operation. Write on short bond paper.		
V. REMARKS			
VI. REFLECTION			
A. No. of learners who earned 80% in the evaluation			
B. No. of learners who require additional activities for remediation			
C. Did the remedial lessons work? No. of learners who have caught up with the lesson			
D. No. of learners who continue to require remediation			
E. Which of my learning strategies worked well? Why did this work?			
F. What difficulties did I encounter which my principal or supervisor can help me solve?			
G. What innovation or localized materials did I use/discover which I wish to share with other teachers?
